Animated Beamer slides in the browser

From One Source to Two Outputs

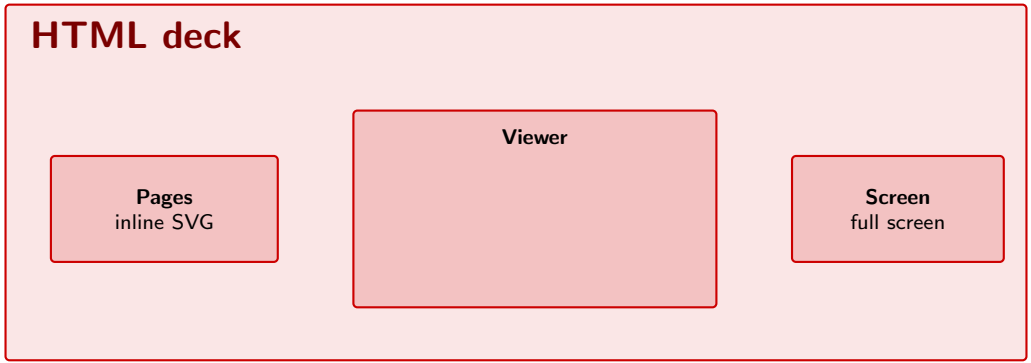

One source file, one build command, two outputs.

From One Source to Two Outputs

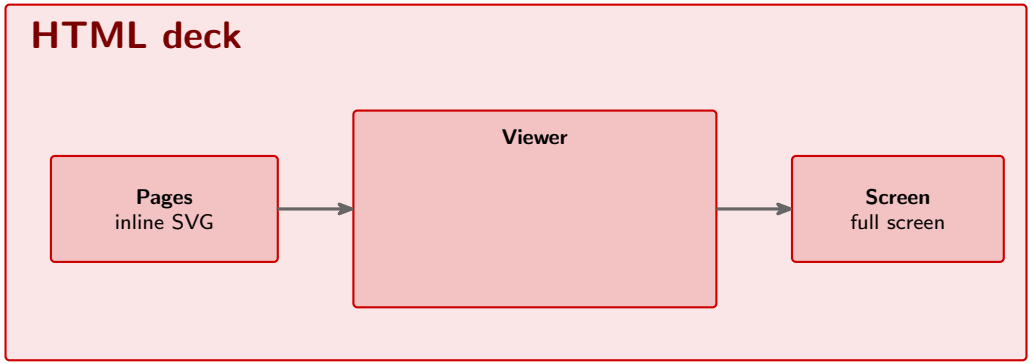

Draw-on: the arrows appear stroke by stroke.

Inside the HTML Deck

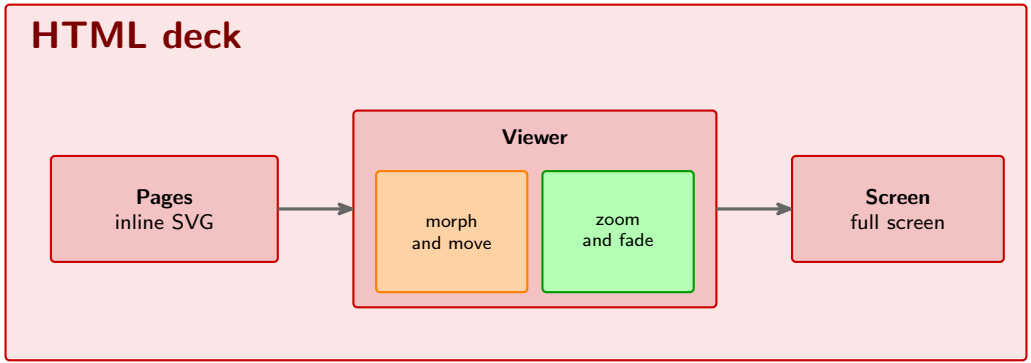

Staged morph: the rest fades out, the block grows, the detail fades in.

Inside the HTML Deck

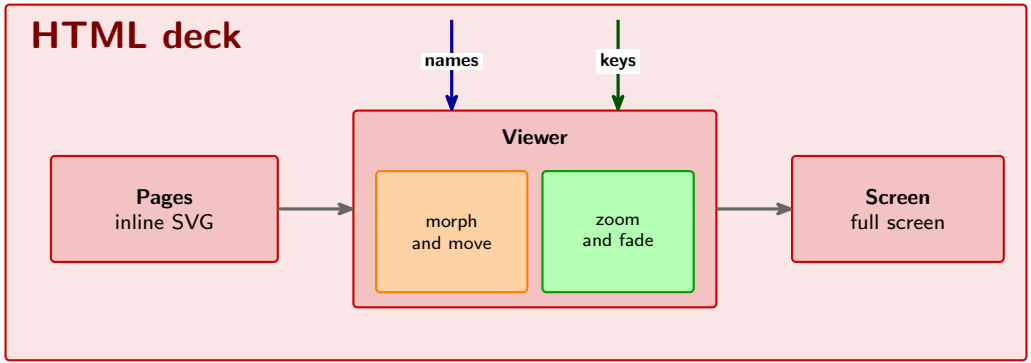

Fade and draw-on: the parts appear.

Inside the HTML Deck

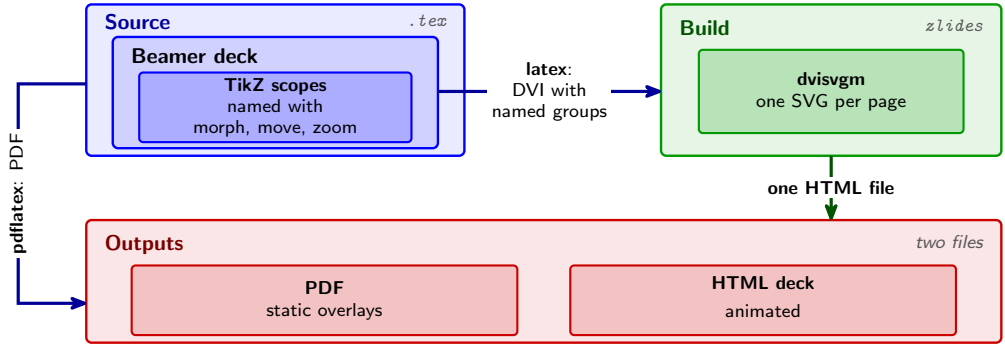

The viewer runs one kind of animation per page change.

Inside the HTML Deck

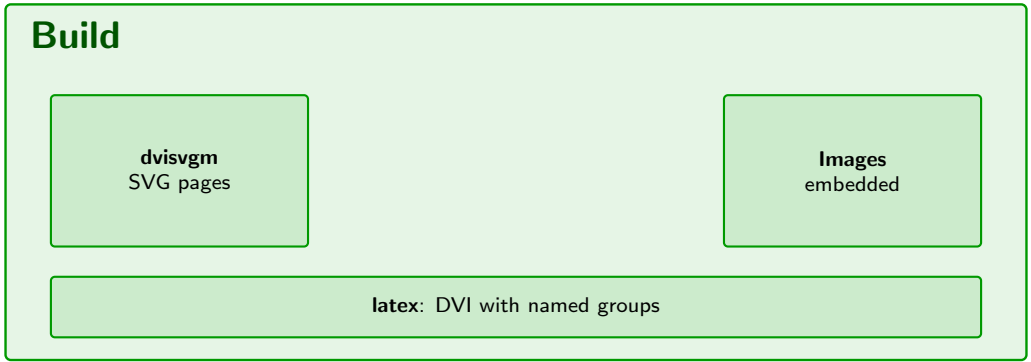

The names come from the TikZ keys. The arrow keys drive the deck.

From One Source to Two Outputs

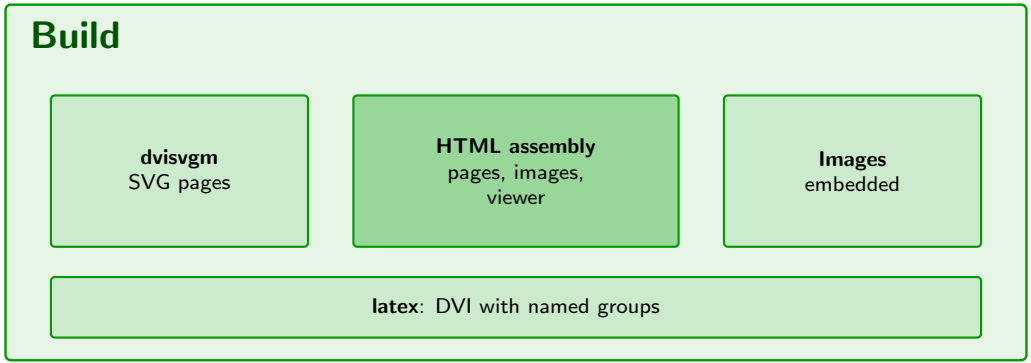

Next: a camera zoom into the build, for comparison.

Inside the Build

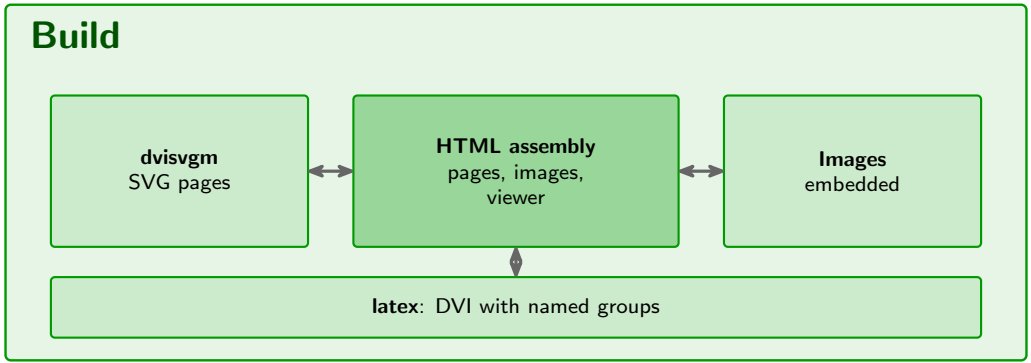

Camera zoom: the view moves into the block, then the detail fades in.

Inside the Build

The build puts pages, images, and the viewer into one file.

Inside the Build

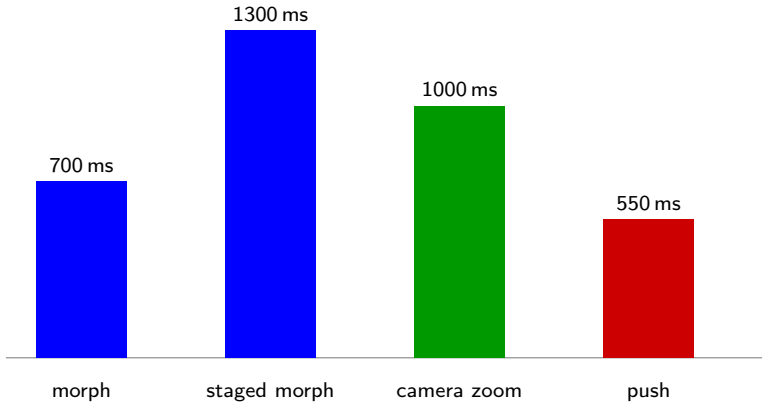

Press the left arrow to zoom back out.

Default Animation Durations

Push transition into this frame.

Default Animation Durations

Grow: each bar morphs from a flat copy.

How the Morph Is Written

Give a scope the same name on two consecutive pages:

```
\only<1>{\begin{scope}[morph=box]
  \fill[blue] (0,0) circle (1);\end{scope}}
\only<2>{\begin{scope}[morph=box]
  \fill[red] (2,0) rectangle (5,2);\end{scope}}
```

The PDF shows the two overlays. The HTML deck morphs the circle into the rectangle.

Harder Morph Cases

ring

open curve

label in a morph

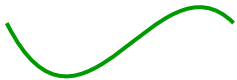

- Ring: each outline morphs on its own, so the hole stays open.
- Open curve: the curve stays open and keeps its two end points.
- Label: content in a morph scope that does not change stays on screen.

Press the right arrow to see the three morphs.

Harder Morph Cases

ring

open curve

label in a morph

- Ring: each outline morphs on its own, so the hole stays open.
- Open curve: the curve stays open and keeps its two end points.
- Label: content in a morph scope that does not change stays on screen.

Press the left arrow to see the morph in reverse.

One Source, Two Outputs

A PDF for print and for Overleaf,
an HTML deck with motion for the talk.

Fade transition into this frame.
